

## WES 237A: Introduction to Embedded System Design (Winter 2025)

In order to report and reflect on your WES 237A labs, please complete this Post-Lab report by the end of the weekend by submitting the following 2 parts:

- Upload your lab 1 report composed by a single PDF that includes your in-lab answers to the bolded questions in the Google Doc Lab and your Jupyter Notebook code.
- Answer two short essay-like questions on your Lab experience.

All responses should be submitted to Canvas. Please also be sure to push your code to your git repo as well.

### Git Repo Setup

1. Edit your git repo public page to include all of your names, a short bio, and contact emails in the README.md public page. See [markdown syntax](#) if needed.

### PYNQ Basics

1. Go through the [PYNQ Documentation](#) and find the PYNQ Z2 Block Diagram for the Base Overlay
2. **What hardware controls the board peripherals (LEDs, buttons, PMOD headers, etc)?**

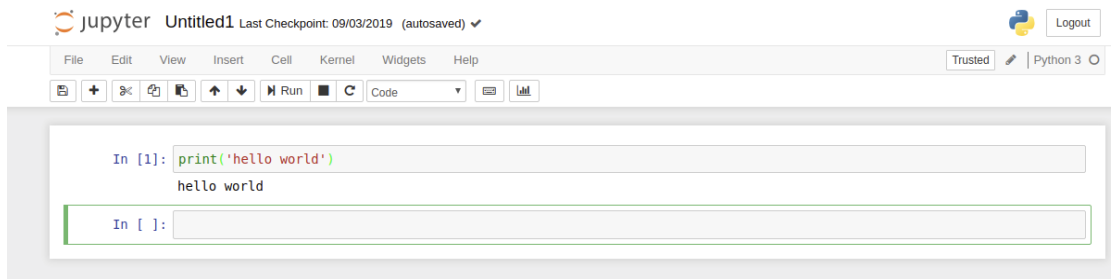

All fixed peripherals are controlled by the Zynq-7000 SoC. When the Base overlay is applied, the PL fabric is instantiated with MicroBlaze soft-processors (processors that are generated in PL) that are programmable and configurable by the PS. This includes the PMODA, PMODB, Rpi and Arduino IO Processors. All other peripherals, such as HDMI in/out, line-in headphone/mic, LEDs, switches and buttons are routed directly into PL. The PS can then interface with these peripherals through the respective IP blocks that control these interfaces. Other “fixed” interfaces, such as USB, GIGe, CAN, I2C, SD, UART, GPIO, Flash, DRAM, and SRAM are controlled directly by the PS.

### Hello World and LEDs

1. Boot the PYNQ board and connect to your wired private network on 192.168.2.99:9090
2. Select 'New' -> 'Folder'

3. Rename the folder to 'Lab1'
4. Go into the folder by double clicking and create a 'New' -> 'Python 3' notebook
5. In the first cell, write 'print("Hello World")'
6. You can run code with the 'Run' button at the top, OR by hitting 'Shift + Enter' at the same time.

The image shows a Jupyter Notebook window titled 'Untitled1'. The top bar includes the Jupyter logo, the title, and a 'Last Checkpoint' timestamp. Below the title bar is a menu bar with 'File', 'Edit', 'View', 'Insert', 'Cell', 'Kernel', 'Widgets', and 'Help'. A toolbar with icons for file operations and execution is located below the menu bar. The main area contains two code cells. The first cell, labeled 'In [1]:', contains the code `print('hello world')` and has executed, showing the output 'hello world'. The second cell, labeled 'In [ ]:', is empty and ready for input.

```
In [1]: print('hello world')
hello world

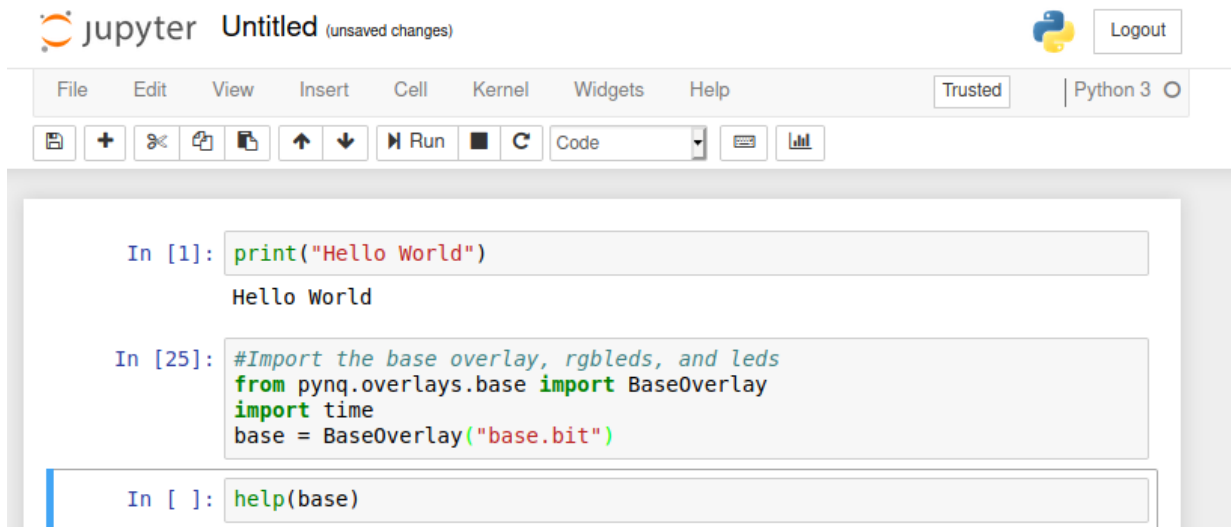

In [ ]:
```

7. Now let's load the base overlay and access some of LEDs
  - a. Import the base overlay and time package with

```
from pyq.overlays.base import BaseOverlay
import time
```
  - b. Load the base overlay

```
base = BaseOverlay("base.bit")
```
  - c. Get the documentation of the base overlay

```
help(base)
```

The image shows a Jupyter Notebook window titled 'Untitled (unsaved changes)'. The top bar includes the Jupyter logo, the title, and a 'Last Checkpoint' timestamp. Below the title bar is a menu bar with 'File', 'Edit', 'View', 'Insert', 'Cell', 'Kernel', 'Widgets', and 'Help'. A toolbar with icons for file operations and execution is located below the menu bar. The main area contains three code cells. The first cell, labeled 'In [1]:', contains the code `print("Hello World")` and has executed, showing the output 'Hello World'. The second cell, labeled 'In [25]:', contains the code `#Import the base overlay, rgbleds, and leds`, `from pyq.overlays.base import BaseOverlay`, `import time`, and `base = BaseOverlay("base.bit")`. The third cell, labeled 'In [ ]:', contains the code `help(base)`.

```
In [1]: print("Hello World")
Hello World

In [25]: #Import the base overlay, rgbleds, and leds
from pyq.overlays.base import BaseOverlay
import time
base = BaseOverlay("base.bit")

In [ ]: help(base)
```

8. Flash the LEDs with an interval of 2 seconds

```
led0 = base.leds[0]
led0.on()
time.sleep(2)
led0.off()
```

```
In [1]: print("Hello World")
Hello World

In [25]: #Import the base overlay, rgbleds, and leds
from pynq.overlays.base import BaseOverlay
import time
base = BaseOverlay("base.bit")

In [ ]: help(base)

In [27]: led0 = base.leds[0]
led0.on()
time.sleep(2)
led0.off()
```

9. Now let's play with the rgb LEDs

```
In [1]: #Now let's deal with the two RGBLEDs
from pynq.overlays.base import BaseOverlay
import pynq.lib.rgbled as rgbled
import time
base = BaseOverlay("base.bit")
```

```
In [ ]: help(rgbled)
```

```
In [2]: led4 = rgbled.RGBLED(4)
led5 = rgbled.RGBLED(5)
```

```
In [3]: #RGBLEDs take a hex value for color
led4.write(0x7)
led5.write(0x4)
```

```
In [4]: led4.write(0x0)
led5.write(0x0)
```

10. Get a PDF of the jupyter notebook

- Go to File->Print Preview then print the print preview page as a PDF
- Or try File->Download As->PDF
- Only one of the two options needs to work.

## ASYNCRIO

1. Download asyncrio\_example.ipynb from [here](#)
2. Upload the asyncrio\_example.ipynb file to the 'Lab1' folder
3. Open the asyncrio\_example.ipynb
4. Code is organized into 'cells'. To run the code in a 'cell', select the cell and hit 'Shift + Enter' at the same time. After running a 'cell', you will see [\*] which means the code is still executing. Once you see a number in the brackets ([3]), the code has completed.
5. Go through the example code and be able to answer the following with a TA during lab
  - a. ***What two lines of code load the FPGA bitstream onto the Programmable Logic (PL) of the PYNQ board?***

```
from pynq.overlays.base import BaseOverlay  
base = BaseOverlay("base.bit")
```

- b. ***Describe in your own words the difference between the 'looping' method and the 'async' method.***

The "looping" method requires the CPU to constantly check the button read state and update the RGB LED values *serially*. With the async method, the task of updating the RGB LEDs and the task of checking the button state can be separated and run in *parallel*.

6. Write code in the section 'Lab Work' to start the LED blinking when 'button 0' is pushed and stop when 'button 1' is pushed.

## GPIO

1. Download gpio\_example.ipynb from [here](#)
2. Upload the gpio\_example.ipynb file to the 'Lab1' folder
3. Open the gpio\_example.ipynb
4. Go through the example code and be able to answer the following with a TA during lab
  - a. ***What is the difference between cells that begin with %%microblaze base.PMODB and cells that don't?***

The “%%” operator tells Jupyter Notebooks to interpret the following string as a cell magic command. PYNQ comes with a few predefined cell magic commands that can be viewed by using %lsmagic:

```
In [11]: %lsmagic
Out[11]: Available line magics:
%alias %alias_magic %autoawait %autocall %automagic %autosave %bookmark %cat %cd %clear %colors %conda %config %co
nnect_info %cp %debug %dhist %dirs %doctest_mode %ed %edit %env %gui %hist %history %killbgscripts %ldir %less %
lf %lk %ll %load %load_ext %loadpy %logoff %logon %logstart %logstate %logstop %ls %lsmagic %lx %macro %magic %
man %matplotlib %mkdir %more %mv %notebook %page %pastebin %pdb %pdef %pdoc %pfile %pinfo %pinfo2 %pip %popd %p
print %precision %prun %psearch %psource %pushd %pwd %pycat %pylab %qtconsole %quickref %recall %rehashx %reload_e
xt %rep %rerun %reset %reset_selective %rm %rmdir %run %save %sc %set_env %store %sx %system %tb %time %timeit
%unalias %unload_ext %who %who_ls %whos %xdel %xmode

Available cell magics:
%%! %%HTML %%SVG %%bash %%capture %%debug %%file %%html %%javascript %%js %%latex %%markdown %%microblaze %%perl
%%prun %%pybind11 %%pypy %%python %%python2 %%python3 %%ruby %%script %%sh %%svg %%sx %%system %%time %%timeit %%
writefile

Automagic is ON, % prefix IS NOT needed for line magics.
```

The microblaze cell magic command is then used to interface with the microblaze soft-processors in the PL fabric. The final argument, base.PMODB specifies the PMODB soft-processor that the following cell will interact with.

### ***b. Why do we reload the 'base' overlay in the second part of the notebook?***

Since we modified the PMODB Microblaze processor (which is in PL), we can reload the 'base' overlay as a quick way of reverting the PMODB Microblaze processor to its default code and restarting its program counter.

5. Write code in the section 'Lab Work' to use two pins (0 and 1) for send and two pins (2 and 3) for receive. You should be able to send 2 bits (0~3) over GPIO. You'll need to hardwire from the send pins to the receive pins.
  - a. Start the code by copying 'cells' 1 and 2 from the beginning of the notebook into the 'Lab Work' section.
  - b. Then begin editing the %%microblaze cell.

# Lab1

January 12, 2025

```
[1]: print("Hello World")
```

Hello World

Import base overlay and time

```
[2]: from pynq.overlays.base import BaseOverlay
import time
```

```
[5]: base = BaseOverlay("base.bit")
```

CLASSES

builtins.object  
 RGBLED

```
class RGBLED(builtins.object)
|   RGBLED(index, ip_name='rgbleds_gpio', start_index=inf)
|
|   This class controls the onboard RGB LEDs.
|
|   Attributes
|   -----
|   index : int
|       The index of the RGB LED. Can be an arbitrary value.
|   _mmio : MMIO
|       Shared memory map for the RGBLED GPIO controller.
|   _rgbleds_val : int
|       Global value of the RGBLED GPIO pins.
|   _rgbleds_start_index : int
|       Global value representing the lowest index for RGB LEDs
|
|   Methods defined here:
|
|   __init__(self, index, ip_name='rgbleds_gpio', start_index=inf)
|       Create a new RGB LED object.
|
|   Parameters
|   -----
|   index : int
|       Index of the RGBLED, Can be an arbitrary value.
|       The smallest index given will set the global value
|       `_rgbleds_start_index`. This behavior can be overridden by
defining
|       `_start_index`.
|   ip_name : str
```

```

|         Name of the IP in the `ip_dict`. Defaults to "rgbleds_gpio".
|     start_index : int
|         If defined, will be used to update the global value
|         `_rgbleds_start_index`.
|
| off(self)
|     Turn off a single RGBLED.
|
|     Returns
|     -----
|     None
|
| on(self, color)
|     Turn on a single RGB LED with a color value (see color constants).
|
|     Parameters
|     -----
|     color : int
|         Color of RGB specified by a 3-bit RGB integer value.
|
|     Returns
|     -----
|     None
|
| read(self)
|     Retrieve the RGBLED state.
|
|     Returns
|     -----
|     int
|         The color value stored in the RGBLED.
|
| write(self, color)
|     Set the RGBLED state according to the input value.
|
|     Parameters
|     -----
|     color : int
|         Color of RGB specified by a 3-bit RGB integer value.
|
|     Returns
|     -----
|     None
|
| -----
| Data descriptors defined here:
|
| __dict__

```

```
|         dictionary for instance variables (if defined)
|
|     __weakref__
|         list of weak references to the object (if defined)
```

#### DATA

    led4.write(0x7)
    led5.write(0x4)
    if btns.read() != 0:
        break
    time.sleep(0.1)
    led4.write(0x0)
    led5.write(0x0)
    if btns.read() != 0:
        break
    time.sleep(0.05)

led4.write(0x0)
led5.write(0x0)

```

## 6 Using asyncio to blink the LEDS and read from buttons

```

[ ]: import asyncio
    cond = True

    async def flash_leds():
        global cond, start
        while cond:
            led4.write(0x1)

```

```

        led5.write(0x7)
        await asyncio.sleep(0.1)
        led4.write(0x0)
        led5.write(0x0)
        await asyncio.sleep(0.05)
        led4.write(0x1)
        led5.write(0x7)
        await asyncio.sleep(0.1)
        led4.write(0x0)
        led5.write(0x0)
        await asyncio.sleep(0.05)

        led4.write(0x7)
        led5.write(0x4)
        await asyncio.sleep(0.1)
        led4.write(0x0)
        led5.write(0x0)
        await asyncio.sleep(0.05)
        led4.write(0x7)
        led5.write(0x4)
        await asyncio.sleep(0.1)
        led4.write(0x0)
        led5.write(0x0)
        await asyncio.sleep(0.05)

async def get_btns(_loop):
    global cond, start
    while cond:
        await asyncio.sleep(0.01)
        if btns.read() != 0:
            _loop.stop()
            cond = False

loop = asyncio.new_event_loop()
loop.create_task(flash_leds())
loop.create_task(get_btns(loop))
loop.run_forever()
loop.close()
led4.write(0x0)
led5.write(0x0)
print("Done.")

```

## 7 Lab work

Using the code from previous cell as a template, write a code to start the blinking when button 0 is pushed and stop the blinking when button 1 is pushed.

```

[ ]: # write your code here.
import asyncio
button0 = 1<<1
button1 = 1<<2
cond = True

async def flash_leds():
    global cond, start
    while True:
        if cond:
            led4.write(0x1)
            led5.write(0x7)
            await asyncio.sleep(0.1)
            led4.write(0x0)
            led5.write(0x0)
            await asyncio.sleep(0.05)
            led4.write(0x1)
            led5.write(0x7)
            await asyncio.sleep(0.1)
            led4.write(0x0)
            led5.write(0x0)
            await asyncio.sleep(0.05)

            led4.write(0x7)
            led5.write(0x4)
            await asyncio.sleep(0.1)
            led4.write(0x0)
            led5.write(0x0)
            await asyncio.sleep(0.05)
            led4.write(0x7)
            led5.write(0x4)
            await asyncio.sleep(0.1)
            led4.write(0x0)
            led5.write(0x0)
            await asyncio.sleep(0.05)
        else:
            led4.write(0x0)
            led5.write(0x0)
            await asyncio.sleep(0.1)

async def get_btns(_loop):
    global cond, start
    while True:
        await asyncio.sleep(0.01)
        read_btns = btns.read()
        if read_btns & button1 != 0:

```

```
        cond = False
    if read_btns & button0 != 0:
        cond = True

loop = asyncio.new_event_loop()
loop.create_task(flash_leds())
loop.create_task(get_btns(loop))
loop.run_forever()
loop.close()
led4.write(0x0)
led5.write(0x0)
print("Done.")
```

    if (val > 1){
        pyprintf("pin value must be 0 or 1");
    }
    else {
        gpio_pin_out = gpio_open(pin);
        gpio_set_direction(pin_out, GPIO_OUT);
        gpio_write(pin_out, val);
    }
}

//Function to read the value of a selected pin of PMODA
unsigned int read_gpio(unsigned int pin){
    gpio_pin_in = gpio_open(pin);
    gpio_set_direction(pin_in, GPIO_IN);
    return gpio_read(pin_in);
}

//Multitasking the microblaze for a simple function
int add(int a, int b){
    return a + b;
}
```

```
[ ]: val = 1
write_gpio(0, val)
read_gpio(1)
```

```
[ ]: add(2, 30)
```

## 3 Lab work

Use the code from the second cell as a template and write a code to use two pins (0 and 1) for send and two pins (2 and 3) for receive. You should be able to send 2bits (0~3) over GPIO. You'll need to hardwire from the send pins to the receive pins.

```
[1]: from pynq.overlays.base import BaseOverlay
      from pynq.lib.pmod.pmod_io import Pmod_IO
      import time
      from datetime import datetime
      base = BaseOverlay("base.bit")
```

```
[2]: %%microblaze base.PMODB

#include "gpio.h"
#include "pyprintf.h"

//Function to turn on/off a selected pin of PMODB
void write_gpio(unsigned int pin, unsigned int val){
    if (val > 1){
        pyprintf("pin value must be 0 or 1");
    }
    else {
        gpio_pin_out = gpio_open(pin);
        gpio_set_direction(pin_out, GPIO_OUT);
        gpio_write(pin_out, val);
    }
}

//Function to read the value of a selected pin of PMODB
unsigned int read_gpio(unsigned int pin){
    gpio_pin_in = gpio_open(pin);
    gpio_set_direction(pin_in, GPIO_IN);
    return gpio_read(pin_in);
}
```

```
[5]: rcvPin1 = 0
      rcvPin2 = 1
      # Looping back PMODA_0 -> PMODB_0, PMODA_1 -> PMODB_1
      sendPin1 = Pmod_IO(base.PMODA,0,'out')
      sendPin2 = Pmod_IO(base.PMODA,1,'out')

      sendVal = 1
      sendPin1.write((sendVal >> 0) & 0x1)
      sendPin2.write((sendVal >> 1) & 0x1)
      rcvdVal1 = read_gpio(rcvPin1)
      rcvdVal2 = read_gpio(rcvPin2)
      print(f"Received Value: {(rcvdVal2 << 1) | rcvdVal1}")
```

Received Value: 1

```
